Summary

- ▶ Learn Harmonic modeling of signals
- ▶ Get an overview of Frequency estimation techniques using Harmonic Model
- ▶ Know about theoretical and practical correlation matrices
- ▶ Understand the details, working and flow of ESPRIT algorithm
- ▶ Understand it's application to DOA estimation in array processing

Summary

Overview Frequency Estimation techniques

The problem:

Given a snapshot of samples $\{x(1), \dots, x(N)\}$,
how to estimate the frequencies present in the data(signal).

Summary

Harmonic model

- ▶ In many applications signals of interest are complex exponentials contained in noise.
- ▶ e.g. formant frequencies in speech processing, moving targets in radar, spatially propagating signals in array processing.

DOA and Array processing

DOA estimation

analogy between general
ESPRIT and for DOA

Summary

Harmonic model

- ▶ Signal containing P complex exponentials in noise:

$$x(n) = \sum_{p=1}^P (\alpha_p e^{j2\pi n f_p}) + w(n)$$

- ▶ Discrete time frequency of p^{th} component is

$$f_p = \frac{\omega_p}{2\pi} = \frac{F_p}{F_s}$$

phase component of each complex exponential is contained in the amplitude, i.e.

$$\alpha_p = |\alpha_p| e^{j\psi_p}$$

- ▶ The power spectrum of complex exponentials is commonly referred to as **line spectrum**

ESPRIT and for DOA

Summary

Autocorrelation matrix of harmonic model

- ▶ Consider a M length snapshot of the signal
i.e

$$\mathbf{x}(n) = [x(n) \ x(n+1) \ x(n+2) \ \dots \ x(n+M-1)]^T$$

- ▶ vector representation of above snapshot

$$\mathbf{x}(n) = \sum_{p=1}^P \alpha_p \mathbf{v}(f_p) e^{j2\pi n f_p} + \mathbf{w}(n) = \mathbf{s}(n) + \mathbf{w}(n)$$

where; $\mathbf{v}(f) = [1 \ e^{2\pi f} \ \dots \ e^{2\pi(M-1)f}]^T$

Summary

Autocorrelation matrix of harmonic model

- ▶ The autocorrelation matrix of this model

$$\mathbf{R}_x = E\{x(n)x^H(n)\} = \mathbf{R}_s + \mathbf{R}_w$$

$$\mathbf{R}_x = \sum_{p=1}^P |\alpha_p|^2 \mathbf{v}(f_p) \mathbf{v}^H(f_p) + \sigma_w^2 \mathbf{I} = \mathbf{V} \mathbf{A} \mathbf{V}^H + \sigma_w^2 \mathbf{I}$$

where

$$\mathbf{V} = [\mathbf{v}(f_1) \quad \mathbf{v}(f_2) \quad \dots \quad \mathbf{v}(f_P)]$$

$$\mathbf{A} = \begin{bmatrix} |\alpha_1|^2 & 0 & \dots & 0 \\ 0 & |\alpha_2|^2 & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \dots & 0 & |\alpha_P|^2 \end{bmatrix}$$

ESPRIT and for DOA

Summary

Signal subspace and noise subspace

- ▶ $\mathbf{R}_x = E\{\mathbf{x}(n)\mathbf{x}^H(n)\} = \mathbf{R}_s + \mathbf{R}_w$
 \mathbf{R}_s is rank-deficient for,
 $P(\# \text{ complex exponentials}) \leq M(\text{time window length})$.
- ▶ The autocorrelation matrix can also be written in terms of eigen decomposition

$$\mathbf{R}_x = \sum_{m=1}^M \lambda_m \mathbf{q}_m \mathbf{q}_m^H = \mathbf{Q} \mathbf{\Lambda} \mathbf{Q}^H$$

λ_m are eigen values in descending order \mathbf{q}_m are corresponding eigen vectors

- ▶ $\lambda_m = M|\alpha_m|^2 + \sigma_w^2$; for $m \leq P$
 $\lambda_m = \sigma_w^2$; for $m > P$
- ▶ $\Rightarrow \mathbf{R}_x = \mathbf{Q}_s \mathbf{\Lambda}_s \mathbf{Q}_s^H + \sigma_w^2 \mathbf{Q}_w \mathbf{Q}_w^H$

Summary

Signal subspace and noise subspace

- ▶ $\Rightarrow \mathbf{R}_x = \mathbf{Q}_s \Lambda_s \mathbf{Q}_s^H + \sigma_w^2 \mathbf{Q}_w \mathbf{Q}_w^H$
- ▶ Subspace spanned by \mathbf{Q}_s columns \leftarrow Signal Subspace
Subspace spanned by \mathbf{Q}_w columns \leftarrow Noise Subspace
- ▶ The above two sub spaces are orthogonal to each other, since the correlation matrix is **hermitian symmetric**
- ▶ Time window frequency vectors $\mathbf{v}(f_p)$'s must lie completely in the signal subspace
- ▶ Basis for subspace based frequency estimation methods

Summary

ESPRIT Algorithm:(Estimation of signal parameters via rotational invariance techniques)

- ▶ Differs from other subspace methods, in the sense that subspace is estimated from data matrix(\mathbf{X}), rather than correlation matrix(\mathbf{R}_x).
- ▶ The essence of ESPRIT lies in the **rotational property** between **staggered sub spaces**.

Summary

- ▶ Harmonic model:

$$\mathbf{x}(n) = \sum_{p=1}^P \alpha_p \mathbf{v}(f_p) e^{j2\pi n f_p} + \mathbf{w}(n) = \mathbf{V} \Phi^n \boldsymbol{\alpha} + \mathbf{w}(n) = \mathbf{s}(n) + \mathbf{w}(n)$$

where, $\Phi = \text{diag}\{\Phi_1, \Phi_2, \dots, \Phi_P\} =$

$$\begin{bmatrix} e^{j2\pi f_1} & 0 & \dots & 0 \\ 0 & e^{j2\pi f_2} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & e^{j2\pi f_P} \end{bmatrix}$$

- ▶ frequencies of the complex exponentials describe this rotation matrix, the frequency estimates can be obtained by finding Φ

Summary

Preliminaries

- ▶ Consider the above staggered windows, i.e.

$$\mathbf{s}(n) = \begin{bmatrix} \mathbf{s}_{M-1}(n) \\ s(n+M-1) \end{bmatrix} = \begin{bmatrix} s(n) \\ \mathbf{s}_{M-1}(n+1) \end{bmatrix}$$

where; $\mathbf{s}_{M-1}(n) = M - 1$ length subwindow of $\mathbf{s}(n) = \mathbf{V}_{M-1}\Phi^n\alpha$

- ▶ We define the matrices:

$$\mathbf{V}_1 = \mathbf{V}_{M-1}\Phi^n$$

and

$$\mathbf{V}_2 = \mathbf{V}_{M-1}\Phi^{n+1}$$

where \mathbf{V}_1 and \mathbf{V}_2 correspond to staggered windows

- ▶ From the above matrices, we can see that

$$\mathbf{V}_2 = \mathbf{V}_1\Phi$$

Each of this two matrices spans a different, though related, $M - 1$ -dim subspace

Summary

Least squares ESPRIT

- ▶ Now, suppose that we have a data matrix \mathbf{X} , with N snapshots of length M time window.
⇒ Using singular value decomposition:

$$\mathbf{X} = \mathbf{L}\mathbf{\Sigma}\mathbf{U}^H$$

where,

\mathbf{L} is an $N \times N$ matrix of left singular vectors

\mathbf{U} is $M \times M$ matrix of right singular vectors

$\mathbf{\Sigma}$ is $N \times M$ singular values along the diagonal

DOA estimation

analogy between general
ESPRIT and for DOA

Summary

Least squares ESPRIT

- ▶ Using singular value decomposition:

$$\mathbf{X} = \mathbf{L}\mathbf{\Sigma}\mathbf{U}^H$$

- ▶ The squared magnitudes of singular values are equal to the eigen values of correlation matrix(\mathbf{R}_x) scaled by a factor N, and columns of \mathbf{U} are corresponding eigen vectors.
- ▶ Thus, \mathbf{U} forms an orthonormal basis for underlying M dimensional space
- ▶ This sub space can be partitioned into signal and noise subspace

$$\mathbf{U} = [\mathbf{U}_s | \mathbf{U}_n]$$

analogy between general
ESPRIT and for DOA

Summary

Least squares ESPRIT

- ▶ This sub space can be partitioned into signal and noise subspace

$$\mathbf{U} = [\mathbf{U}_s | \mathbf{U}_n]$$

- ▶ \mathbf{U}_s is matrix of right handed singular vectors corresponding to singular values of P largest magnitudes.
- ▶ The matrices \mathbf{V} and \mathbf{U}_s span the same subspace,
 \Rightarrow There exists a invertible transformation \mathbf{T} , that maps \mathbf{U}_s to \mathbf{V} i.e.

$$\mathbf{V} = \mathbf{U}_s \mathbf{T}$$

- ▶ Similar staggering matrices of \mathbf{V} can be defined for \mathbf{U}_s , say, \mathbf{U}_1 and \mathbf{U}_2

ESPRIT algorithm

Preliminaries

Least squares ESPRIT

Total least squares ESPRIT

ESPRIT for DOA estimation

DOA and Array processing

DOA estimation

analogy between general ESPRIT and for DOA

Summary

Least squares ESPRIT

- ▶ staggered matrices of \mathbf{U}_s : \mathbf{U}_1 and \mathbf{U}_2
staggered matrices of \mathbf{V} : \mathbf{V}_1 and \mathbf{V}_2
holds the relation,

$$\mathbf{V}_1 = \mathbf{U}_1 \mathbf{T} \text{ and } \mathbf{V}_2 = \mathbf{U}_2 \mathbf{T}$$

- ▶ Similar to \mathbf{V}_1 and \mathbf{V}_2 , \mathbf{U}_1 and \mathbf{U}_2 are related by a rotation matrix Ψ

$$\mathbf{U}_2 = \mathbf{U}_1 \Psi$$

- ▶ Now, we solve for Ψ using least squares,

$$\Psi = (\mathbf{U}_1^H \mathbf{U}_1)^{-1} \mathbf{U}_1^H \mathbf{U}_2$$

Summary

Least squares ESPRIT

$$\mathbf{V}_2 = \mathbf{U}_2 \mathbf{T} = \mathbf{U}_1 \mathbf{\Psi} \mathbf{T}$$

$$\mathbf{V}_2 = \mathbf{V}_1 \mathbf{\Phi} = \mathbf{U}_1 \mathbf{T} \mathbf{\Phi}$$

- ▶ From above two equations, we can write

$$\begin{aligned}\mathbf{\Psi} \mathbf{T} &= \mathbf{T} \mathbf{\Phi} \\ \Rightarrow \mathbf{\Psi} &= \mathbf{T} \mathbf{\Phi} \mathbf{T}^{-1}\end{aligned}$$

this equation can be recognized as relationship between eigen vectors and values of $\mathbf{\Psi}$

- ▶ therefore, the diagonal elements of $\mathbf{\Phi}$ are simply the eigen values of $\mathbf{\Psi}$
- ▶ as a result the estimates of frequency are

$$\hat{f}_p = \frac{\phi_p}{2\pi}$$

Summary

DOA estimation

- ▶ For all the P sources and M length ULA, the signal model is a superposition of signals from all the P sources
- ▶ The received signal at ULA is represented as:

$$\mathbf{y}(n) = [\mathbf{a}(\Delta_1), \mathbf{a}(\Delta_2), \dots, \mathbf{a}(\Delta_P)] \begin{bmatrix} s_1(n) \\ s_2(n) \\ s_3(n) \\ \vdots \\ s_P(n) \end{bmatrix} + \mathbf{w}(n)$$

- ▶ This is similar to the harmonic model, that we had considered for applying ESPRIT algorithm
- ▶ i.e. $\mathbf{V} = [\mathbf{a}(\Delta_1), \mathbf{a}(\Delta_2), \dots, \mathbf{a}(\Delta_P)]$
- ▶ This \mathbf{V} can be split into staggered sub-spaces \mathbf{V}_1 and \mathbf{V}_2

Summary

Summary

- ▶ The **ESPRIT algorithm** is a parametric spectrum estimation method, it is one of the super-resolution method.
- ▶ it turns out that we can use this method for DOA estimation, since both problem are one and the same, just an interchange play between frequency and phase delay terms
- ▶ ESPRIT makes use of **rotational property** of staggered sub spaces and comparing a match between the harmonic model and SVD of data matrix.
- ▶ It involves **SVD and least squares concept**.
